

WordPress Archive

Overview

The default WordPress pagination does not well suit the needs of our news sites for a number of reasons primarily due to waste of crawl budget and our [noindexation plugin](#). This proposed plugin will better suit user needs, and help to better sculpt PageRank to pages we care about.

N.B. This is from a previous proposal detailed [here](#), this was never picked up due to the unstable/outdated nature of WordPress.

How will the proposed WordPress plugin

The proposed WordPress plugin which will create

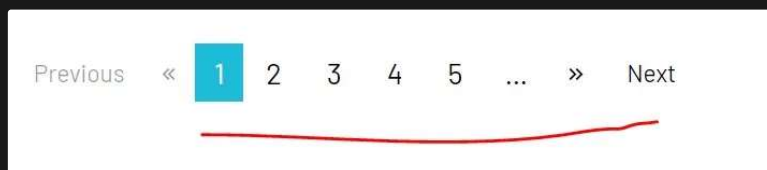

- A combined HTML Sitemap and JS powered archive
- A replacement for our current noindex pagination of taxonomy pages

Archive/sitemap

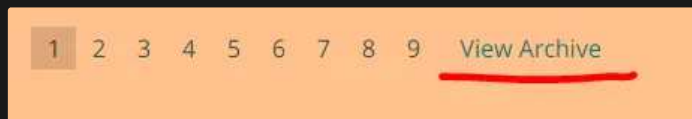

The goal is to create an archive page which will also serve as a HTML sitemap similar to that found on [techradar](#)

Pagination

The goal is to replace our current approach to pagination

With a more limited sequence which links to the archive like:

What does this achieve?

Without a through understanding of [click-depth](#) and [pagination](#) it's difficult to explain but essentially this will help **new articles** on news sites and **old articles** on blogs to rank. In the former case by reducing the leak of PageRank to older content, in the latter by reducing the impact of link decay (reduction of PageRank caused by pages moving down archive pages) on our most important evergreen content

How will this work:

The user admin page will require

- <user defined pagination limit, default 1> before archive link

should we do 1 a

 Nick Kisberg 09

- Blog/News page toggle (the plugin will create either a News page, or a Blog page as defined by the user)
- **if Blog:**
 - **MVP:** version will include text input or csv import to define URLs to include <user specified number of top URLs, **default 100**>
 - **Final version:** Will use snowflake or adobe to define URLs to include <user specified number of top URLs, **default 100**>
- **else if News:**
 - Links to all content published in last <user specified time range, **default 72**> hours
- Archive link type toggles:
 - Title (default on)
 - Description (default off)
 - Featured image (default off)
- User defined Search/Filters (binary on/off selection) these will need to be done client side using JS:
 - Search Box
 - Category filters
 - Tag filters
 - Month +Year filters
 - Author filters
